

EGS provided Caltrans' general engineering contractor with specialized soil sampling services for select contaminant screening in conjunction with a number of major land slide repairs and highway stabilization projects between Jenner and Ft. Ross, CA. We prepared a CIH certified Work Plan and Site Health & Safety Plan, a soil sampling plan in accordance with the requirements of EPA Manual SW-846 (random sampling specification and documentation), and collected and delivered 133 samples from 3 project locations along Highway 1 between Jenner and Ft. Ross. Then we reviewed laboratory analytical results and prepared a report in accordance with Caltrans specifications. Our final report documented the sampling protocols, the analytical results and our findings and recommendations for soil disposition in accordance with Caltrans and property owner requirements.
