

The USACoE Skaggs Springs Road construction yard / corporation yard, fish hatchery and pump station sites contained several gasoline and diesel underground storage tanks (USTs) that required removal and investigation. EGS responded to the USACoE's RFB and was selected to prepare Work Plans to conduct the subsurface investigations of these three sites.

After Work Plan approval by the Sonoma County Environmental Health Department and CoE, we implemented subsurface investigations at each site by drilling borings and collecting groundwater and soil samples, analyzing samples for TPH-G/D/MTBE/BTEX and lead. Based on findings we determined there was contamination at all three sites and we prepared Work Plans for UST removals and subsequent investigation / remediation.
