

In the western States there are numerous problems related to geologic, soils, and water conditions. In periods of higher than normal rainfall, during drought conditions, or when strong earthquake shaking occurs, failures to foundations and other structural systems occur. In addition, poor design and construction practices can result in failures.

Environmental Geology Services, Inc. has provided services for owners, insurance companies, and attorneys to determine the cause of geotechnical failures, earth movement, erosion, flooding, seismic damage, as well as hazardous materials / environmental impairment for numerous cases. We can provide a list of experience on cases involving Failure Analysis, Expert Witness, Testimony, and Expert Consultant Services, on request.
