

A common environmental and regulatory problem is leaking underground storage tanks (UST's). We promptly respond to emergency situations where UST's or the related contamination is discovered during construction or real estate transaction activities. In addition, we provide removal services for planned renovations and upgrades of UST systems. For these services EGS provides contractor selection, permitting, management of removal and disposal, initial and verification sampling and analysis of soil and groundwater, regulatory interfacing and reporting. Where contamination problems are discovered, we provide complete site characterization, monitoring and remediation through case closure. When the UST is covered by insurance (such as the California State UST Cleanup Fund, <http://www.waterboards.ca.gov/cwphome/ustcf/index.html>) we provide client cost recovery and reimbursement services.
